APPL-DATE: June 7, 2006

PRIORITY-DATA: 1994289148 (August 10, 1994)

ABSTRACT:

PROBLEM TO BE SOLVED: To detect programming errors in a computer program.

SOLUTION: A computer program statement (command) like a function stored in a memory 104 is performed by a CPU 102. The CPU 102 monitors changes in state of a resource (a memory 114) to be processed by the computer program and when it deviates from a predetermined change in state, decides it as a programming error.
